1. Open the folder where your TWRP Recovery .img file
2. Then open a CMD window inside that folder, to do t
empty white space inside the folder and then select
3. Connect your Android device to the PC. Type the foll
to boot your device into bootloader/fastboot mode.
for permission to "Allow USB debugging", tap OK.
adb_shell

C:\WINDOWS\system32>adb pull /sdcard/laf.img
5606 KB/s (33554432 bytes in 5.844s)

C:\WINDOWS\system32>
```

Type the following:

```
adb shell
```

```
su
```

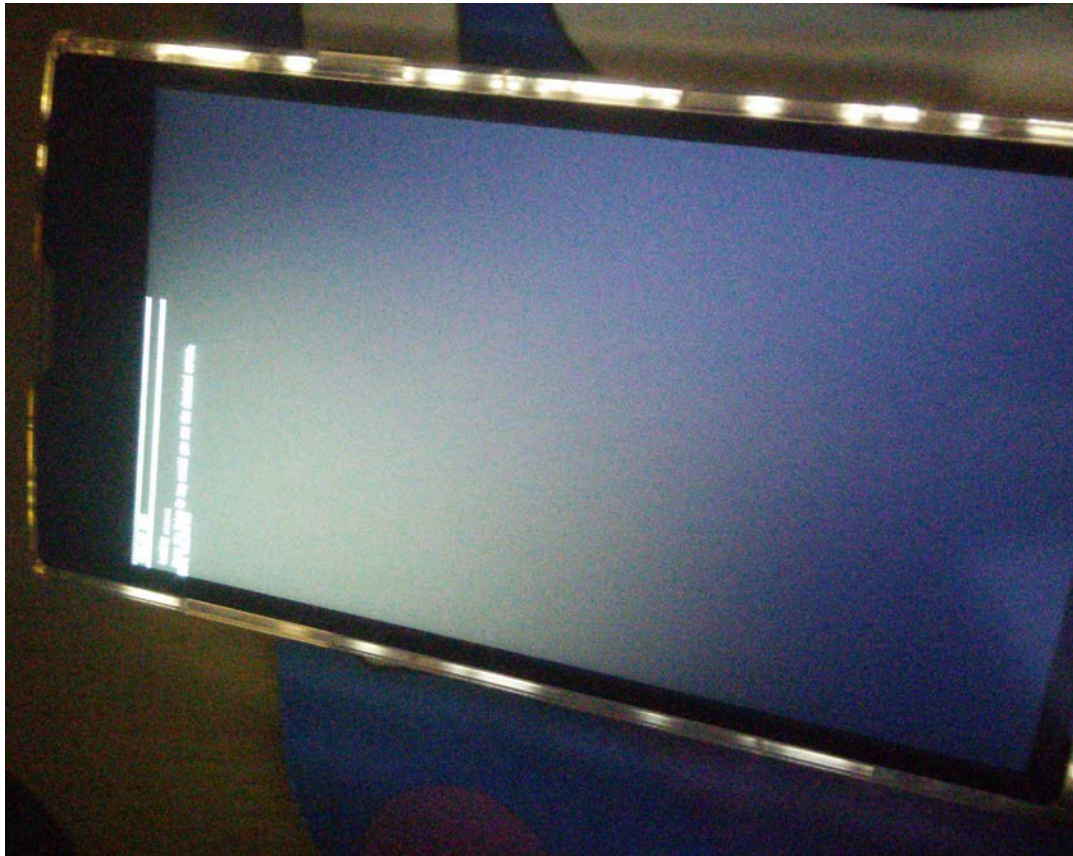

- Type: `dd if=/dev/zero of=/dev/block/platform/msm_sdcc.1/by-name/laf`
(The Command will say it has “no more space on device” but below has said it has transferred)

Then Type: `adb reboot`

Power off the phone and unplug

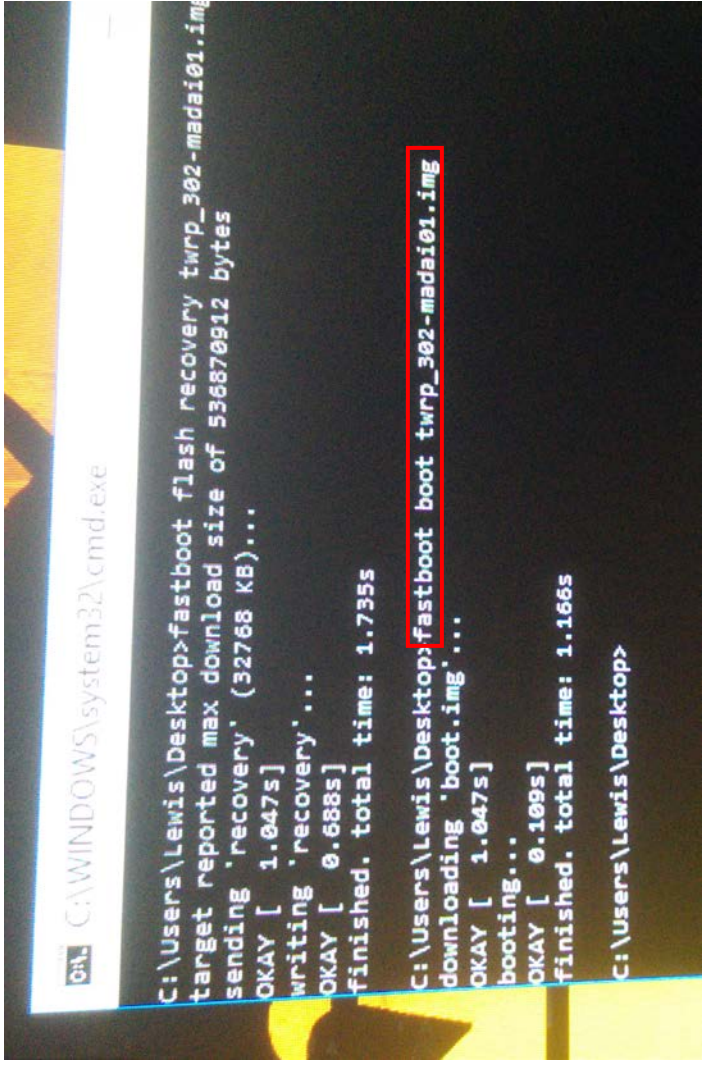

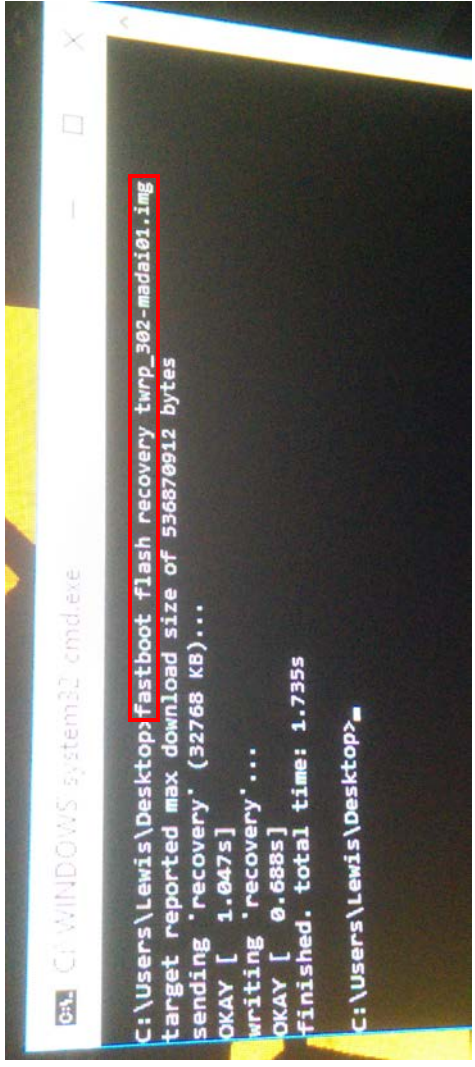

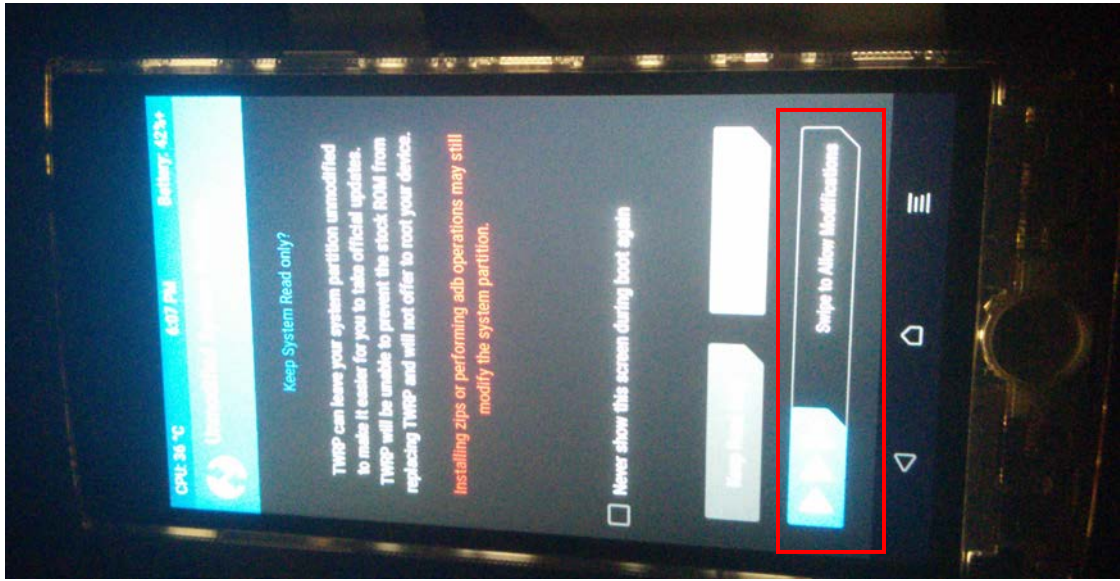

Hold Volume UP and plug in usb cable

Now you should be in Fastboot Mode (looks like this, says “download mode” `udc_start` or something)

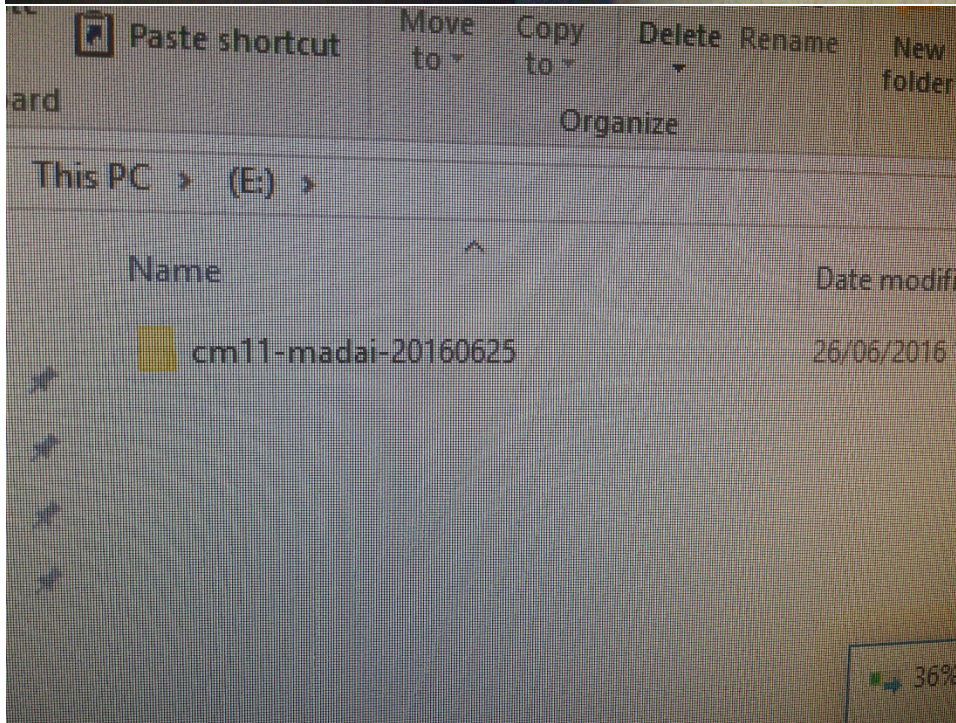

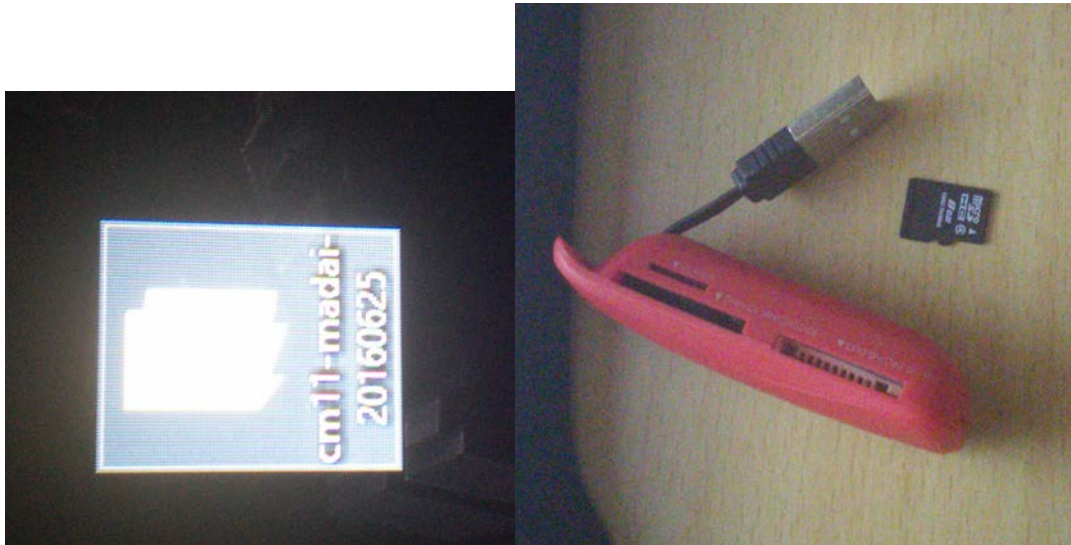

After you plug the phone in-

Open Command prompt where the `twrp_302-madai01.img` file is by SHIFT+RIGHT clicking in a blank area where the file is. (I put everything on my Desktop including `adb.exe` and `fastboot.exe`)

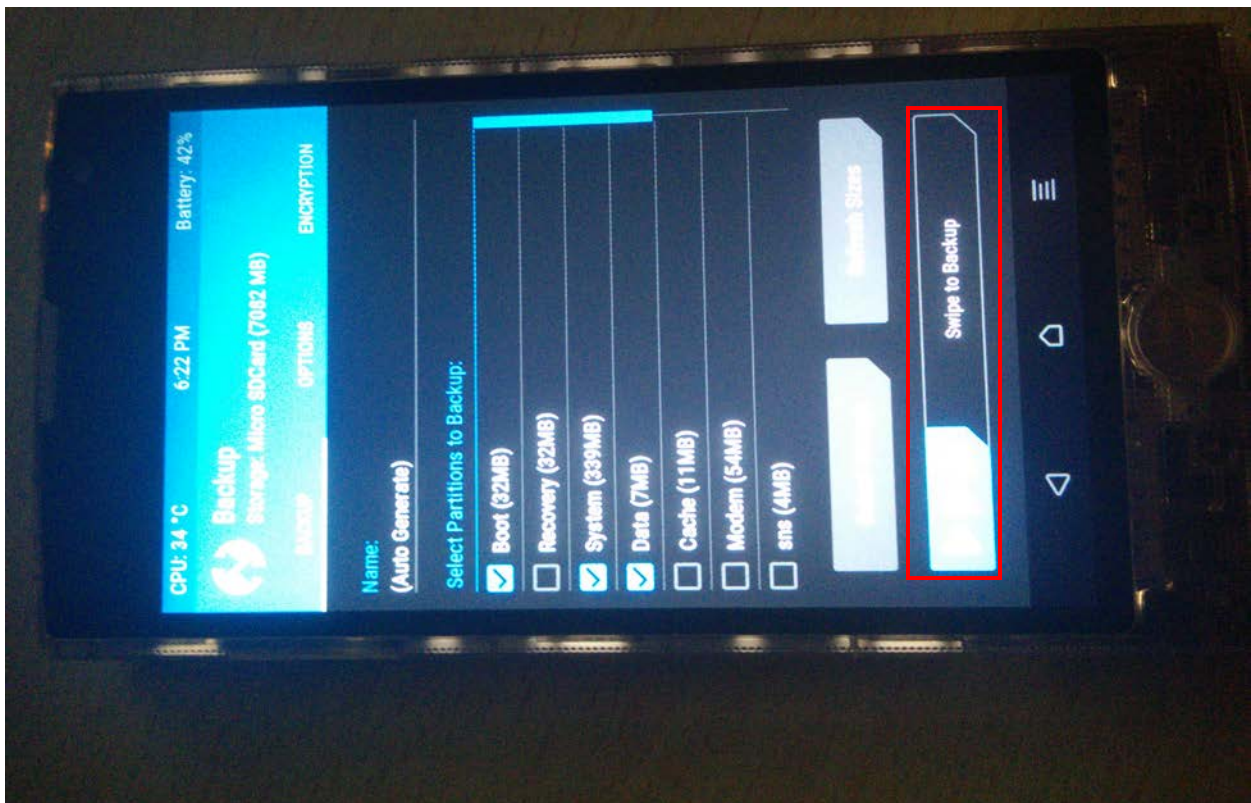

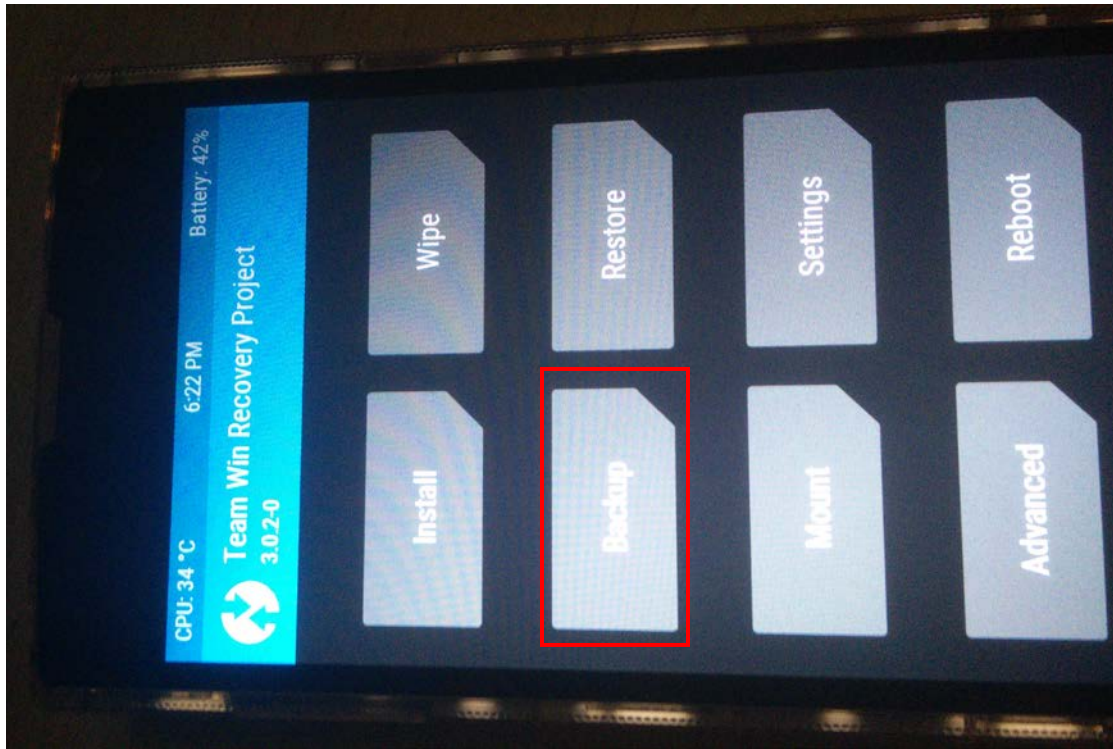

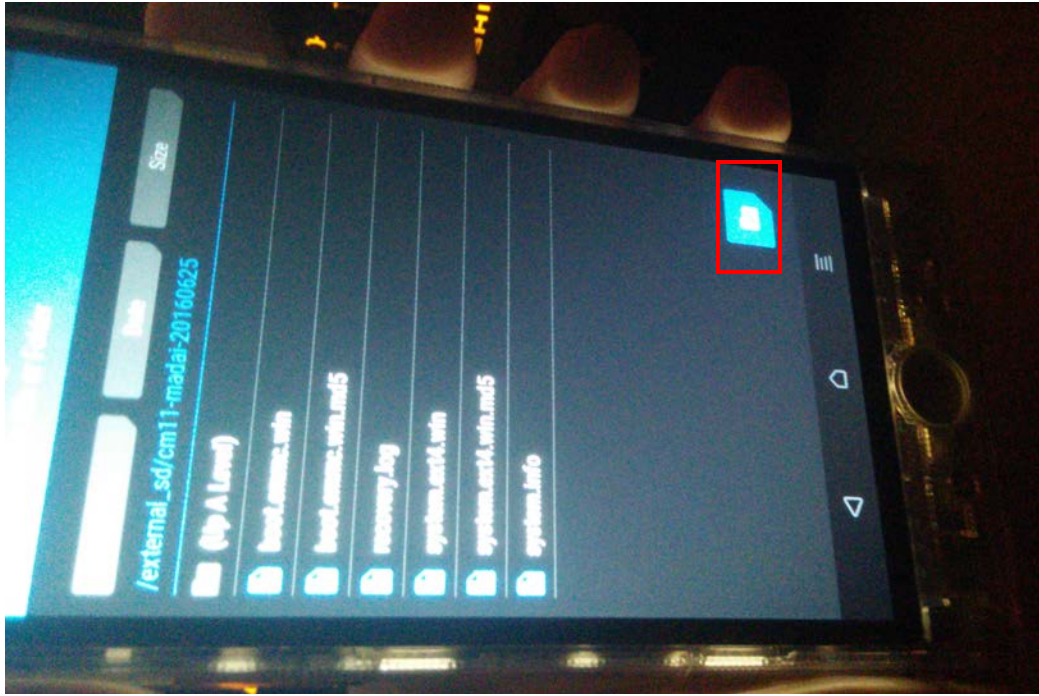

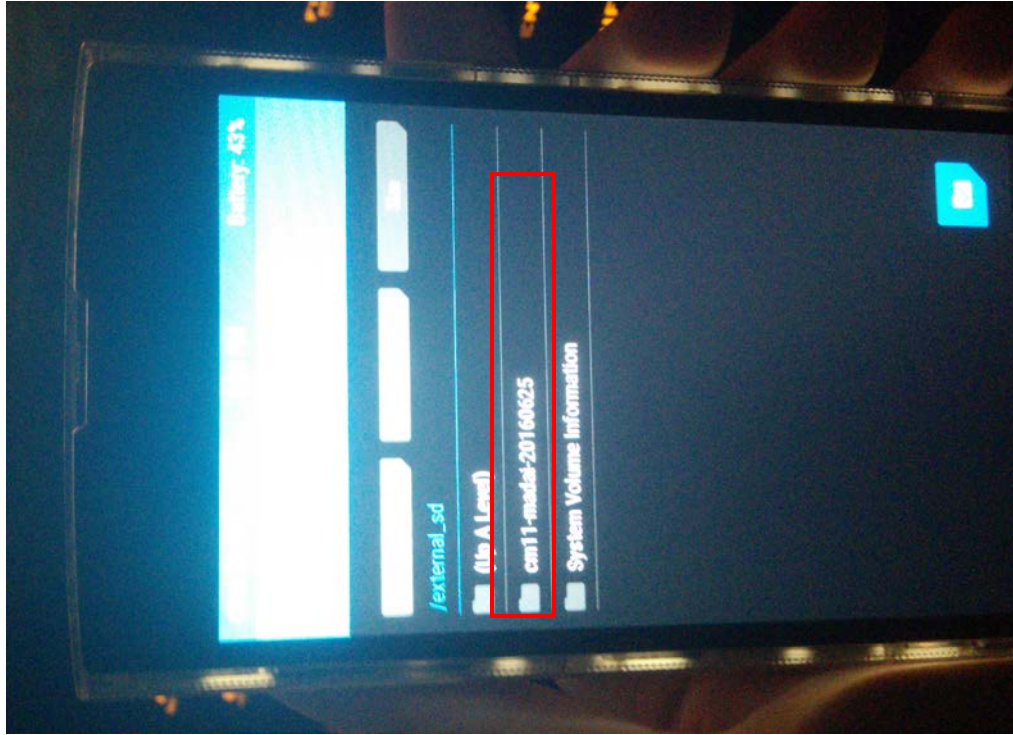

Now that you're into TWRP, you need to put the Cyanogen Restore Folder on the phone using an SD-CARD

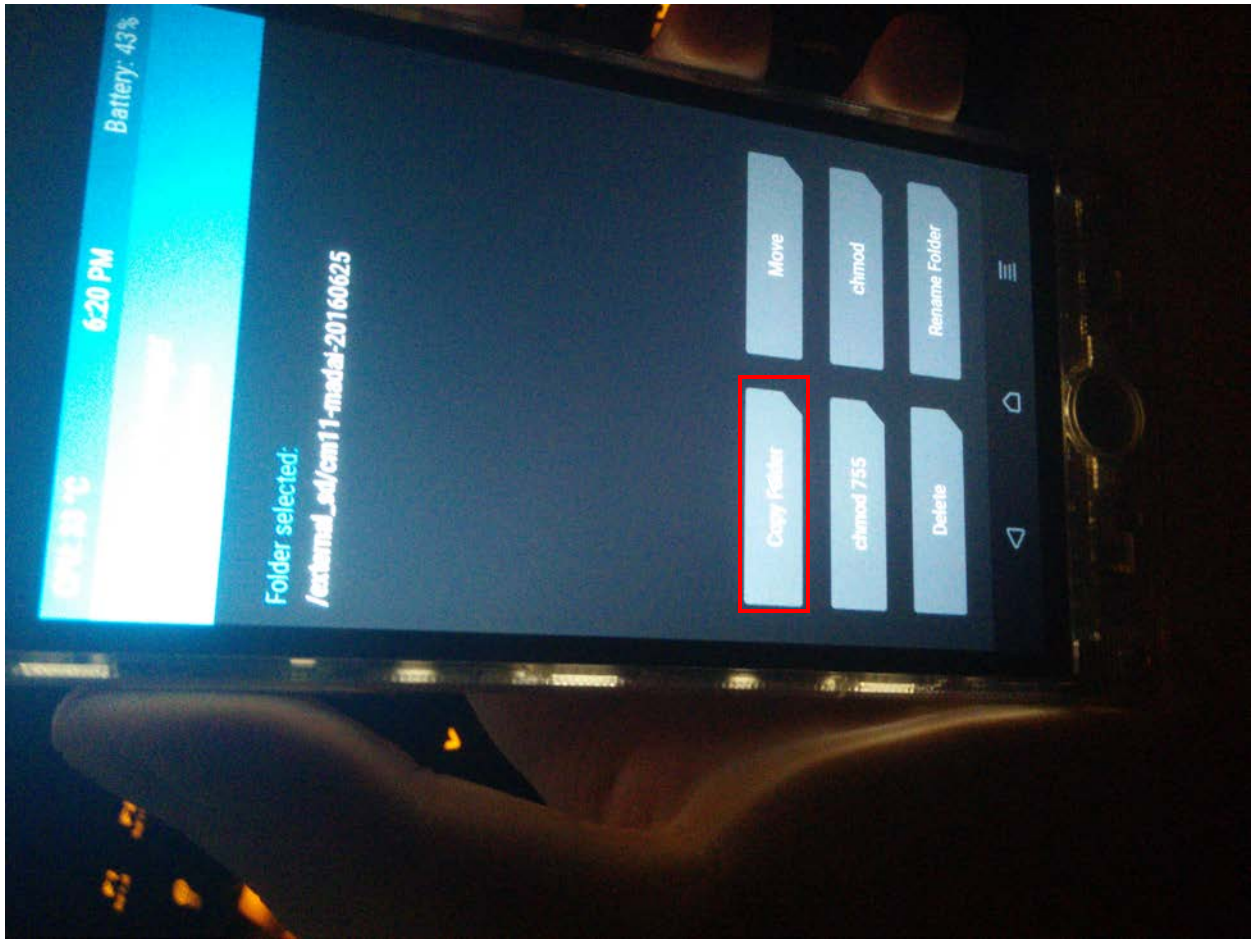

I used an adapter for the micro sd-card

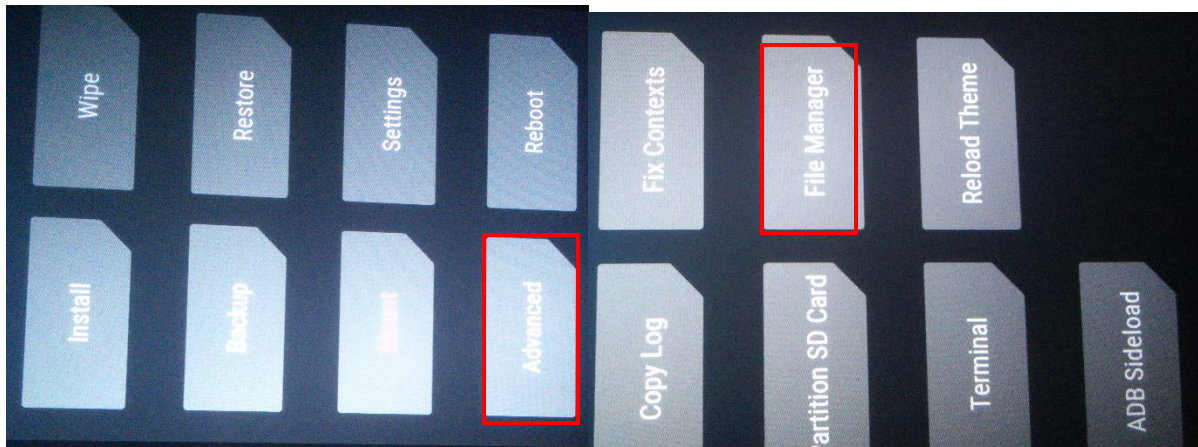

Make a Backup onto the SDCARD (just a quick “fake” one so that TWRP creates a BACKUP Folder)
Reboot into recovery after backup completes

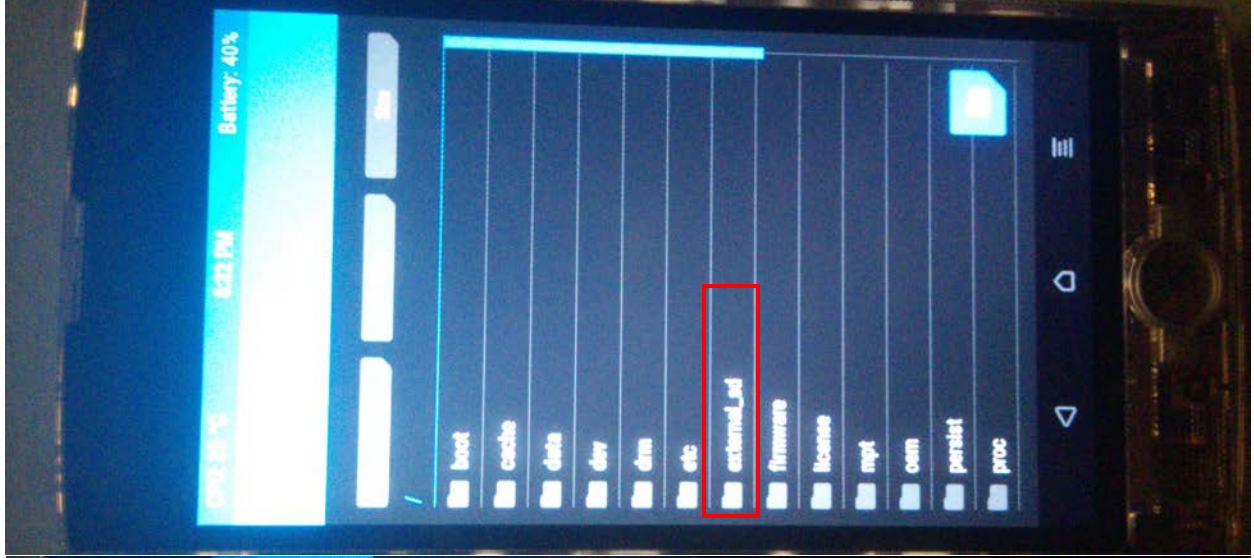

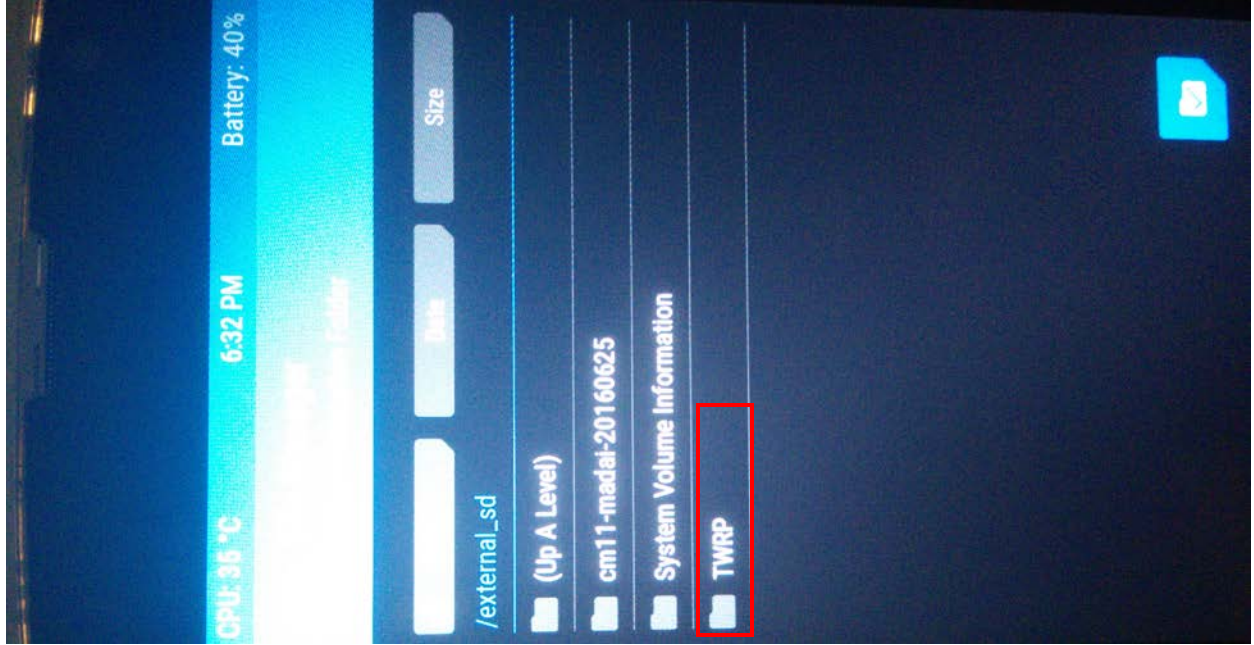

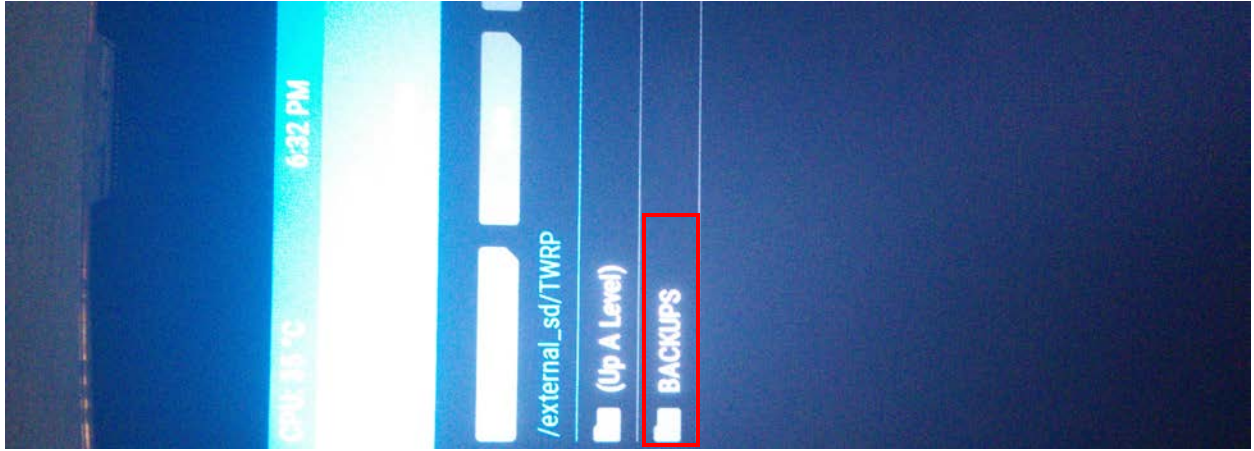

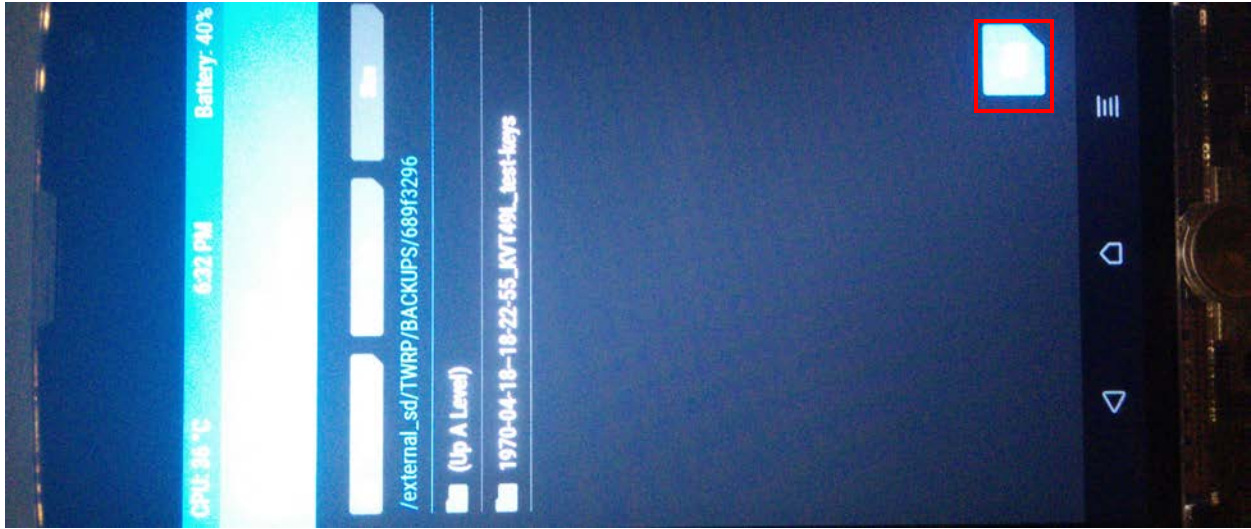

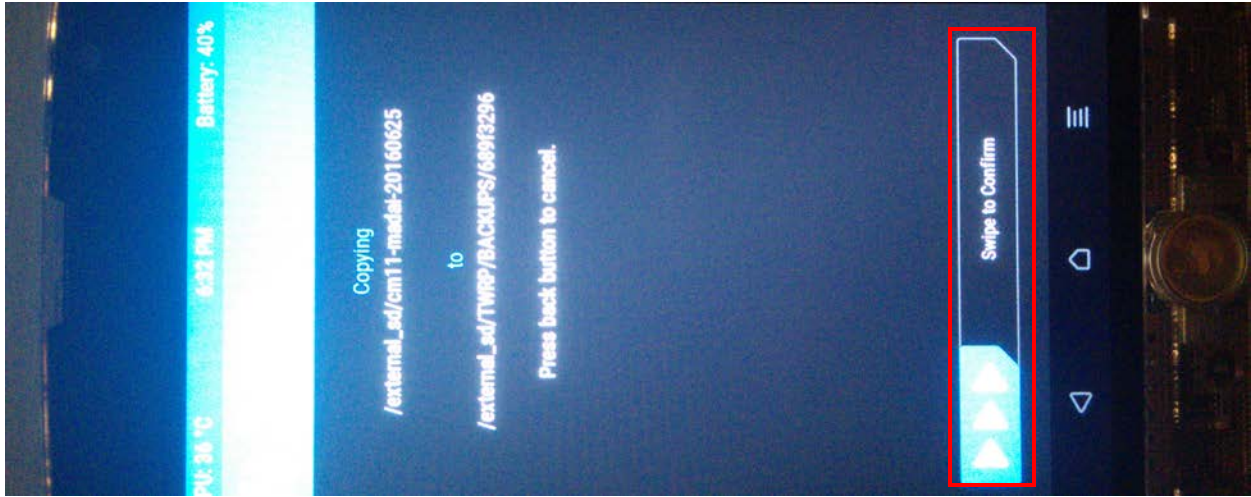

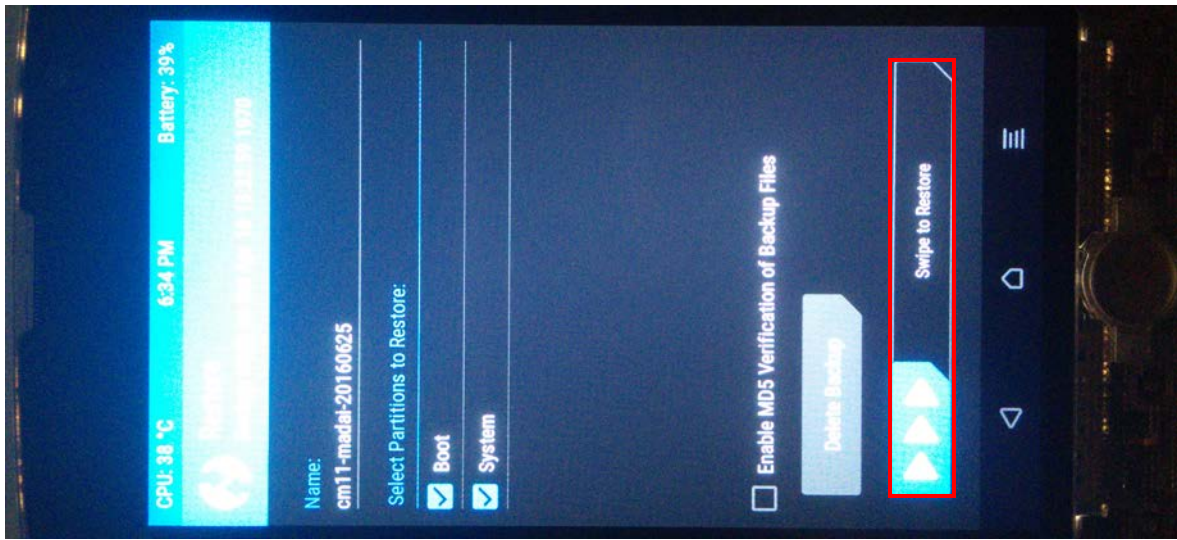

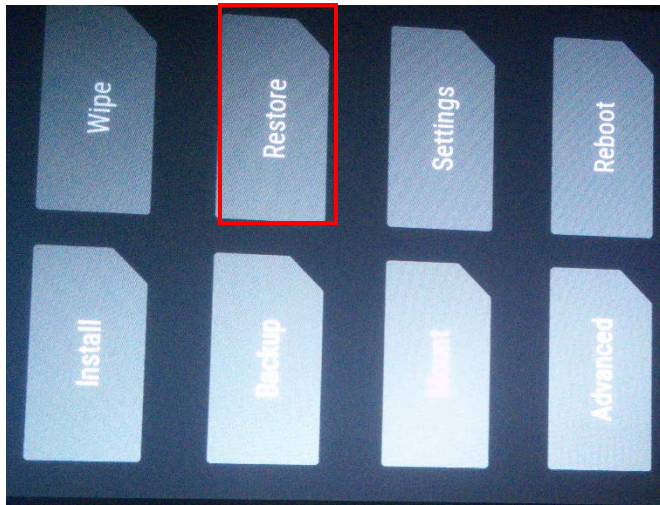

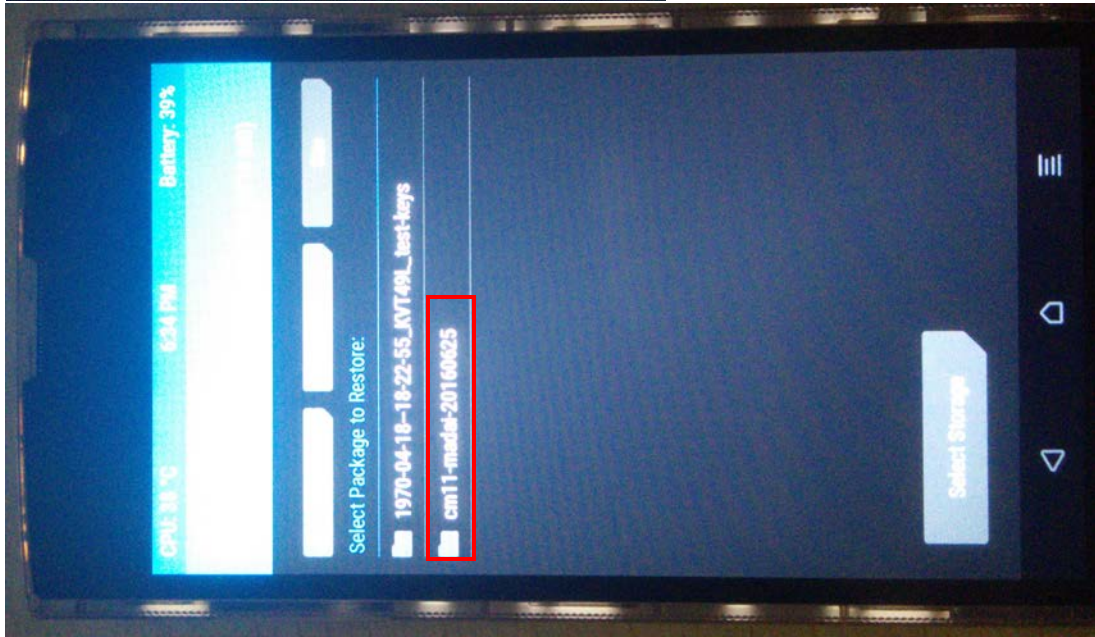

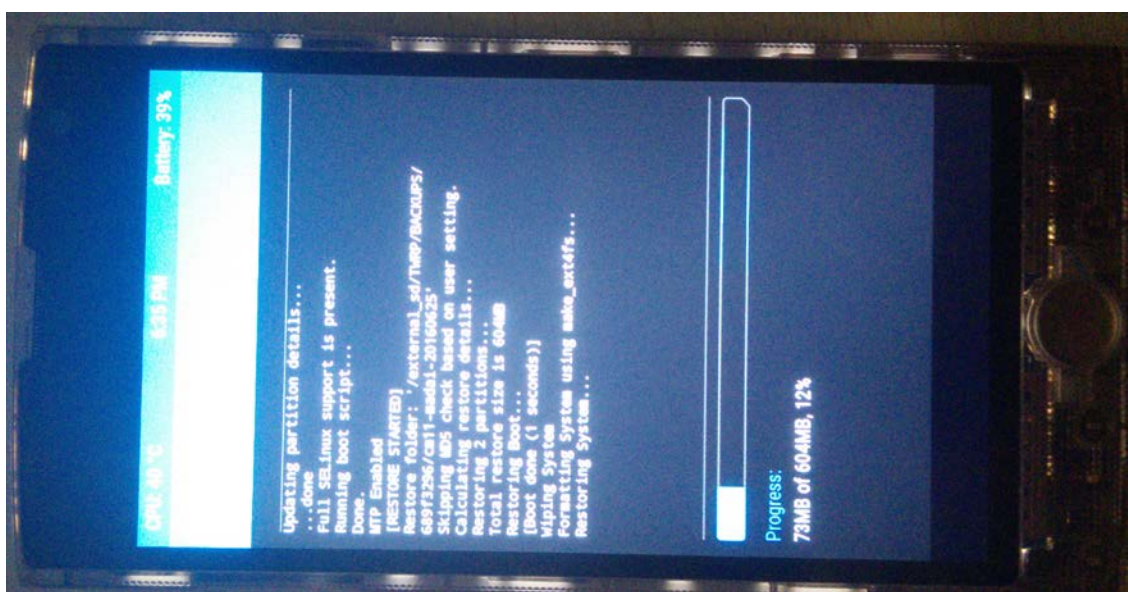

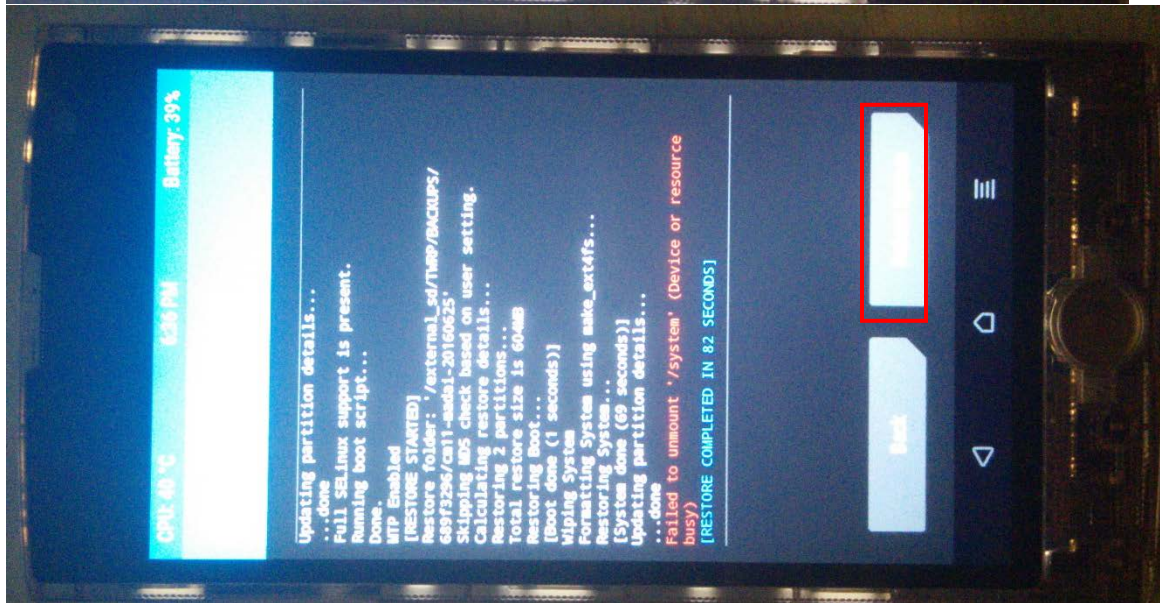

Now Copy the Cyanogen Restore Folder into the ExternalSD Backup Folder

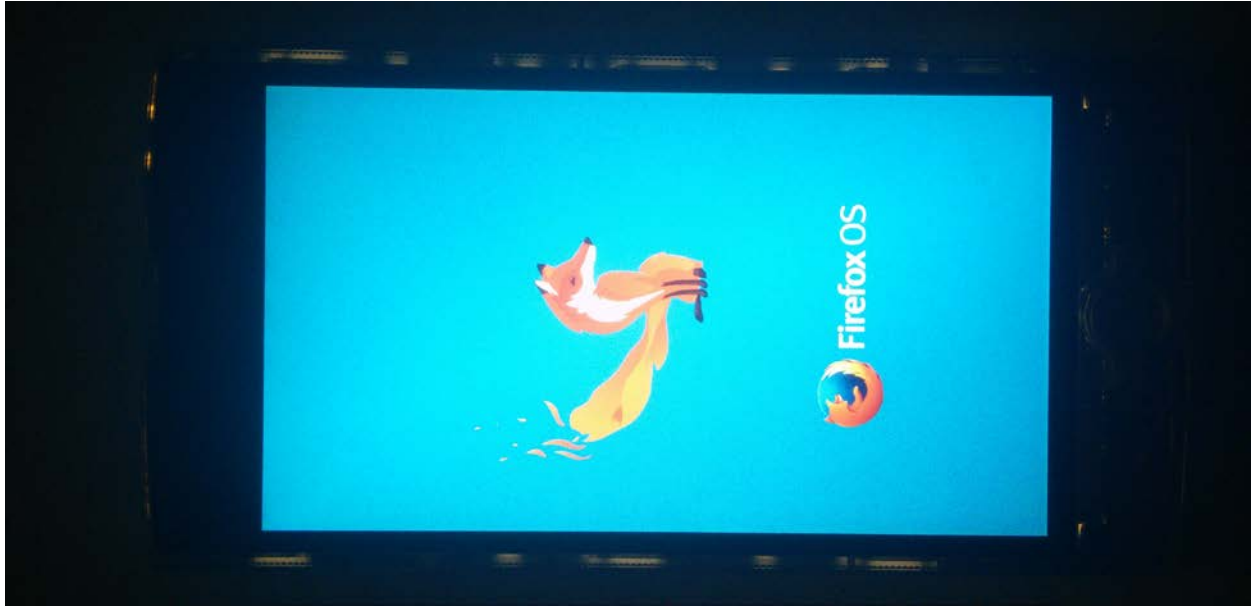

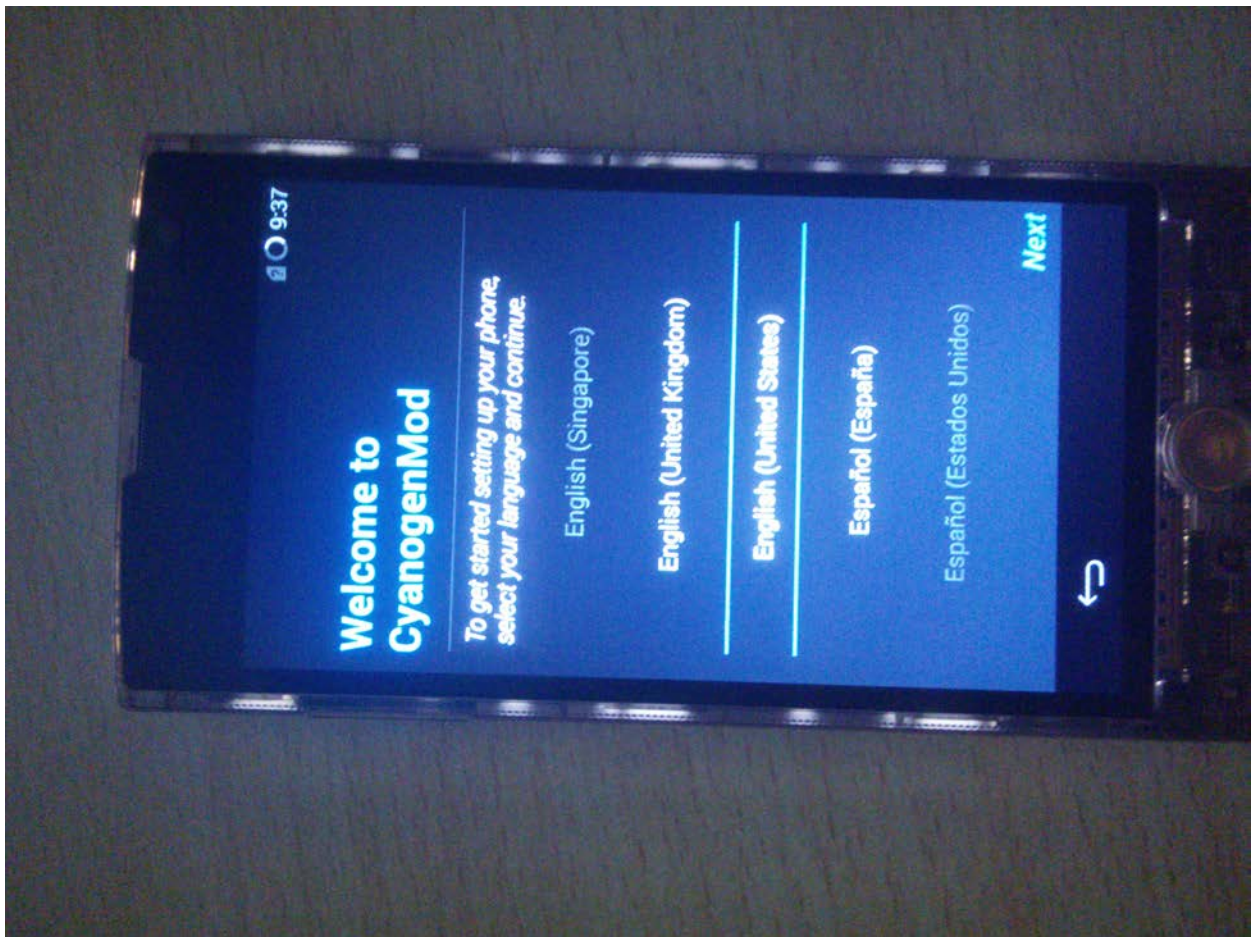

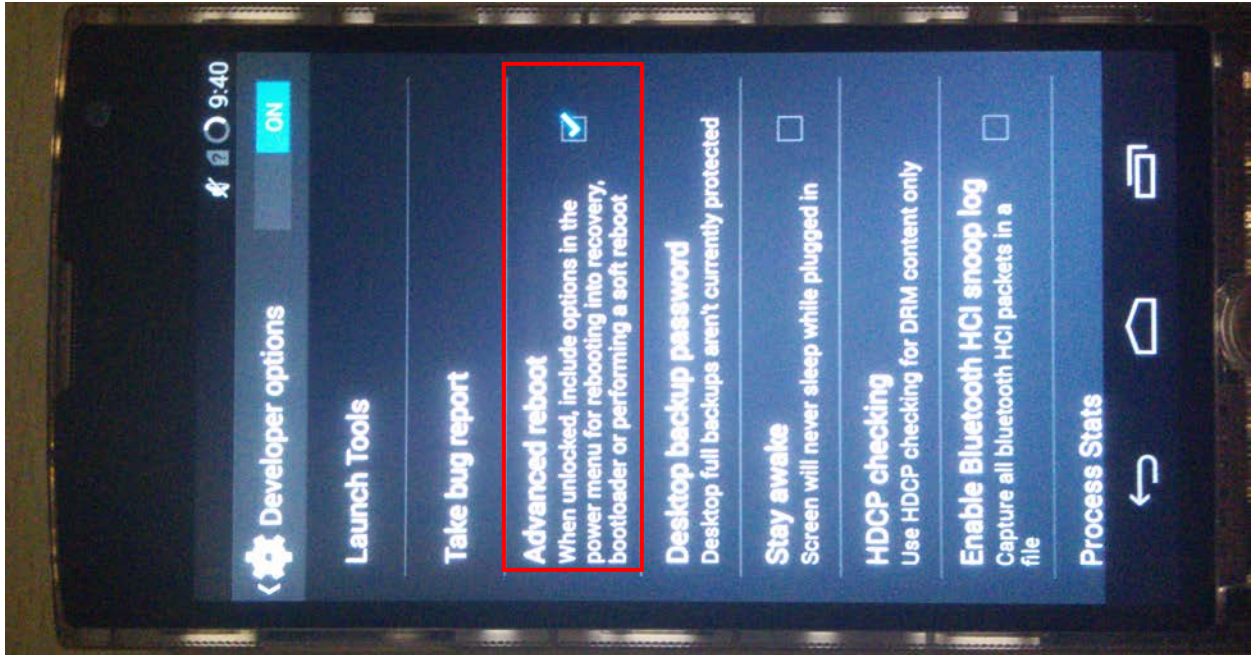

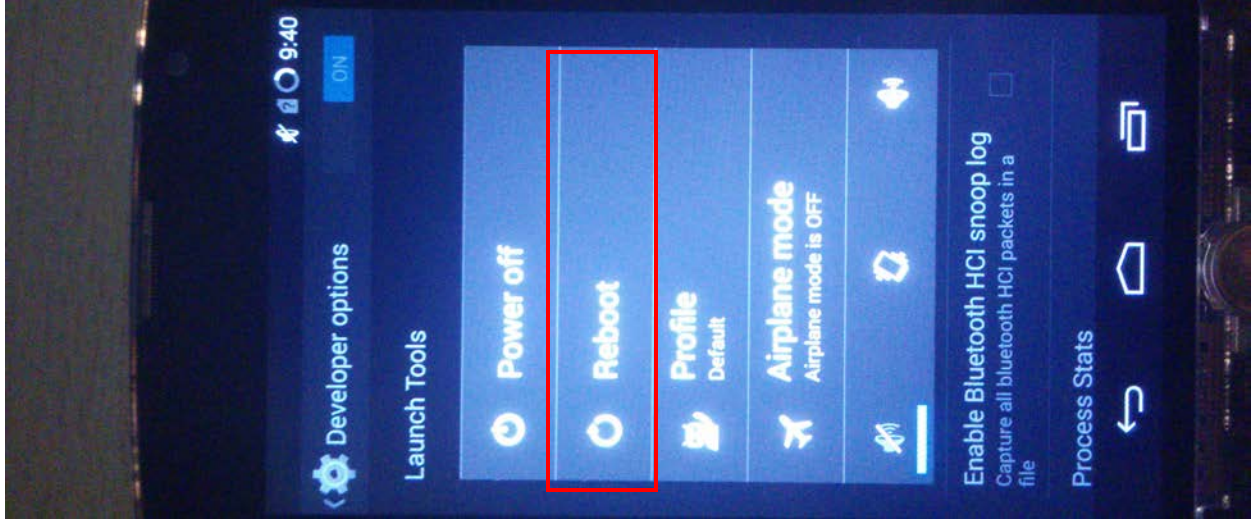

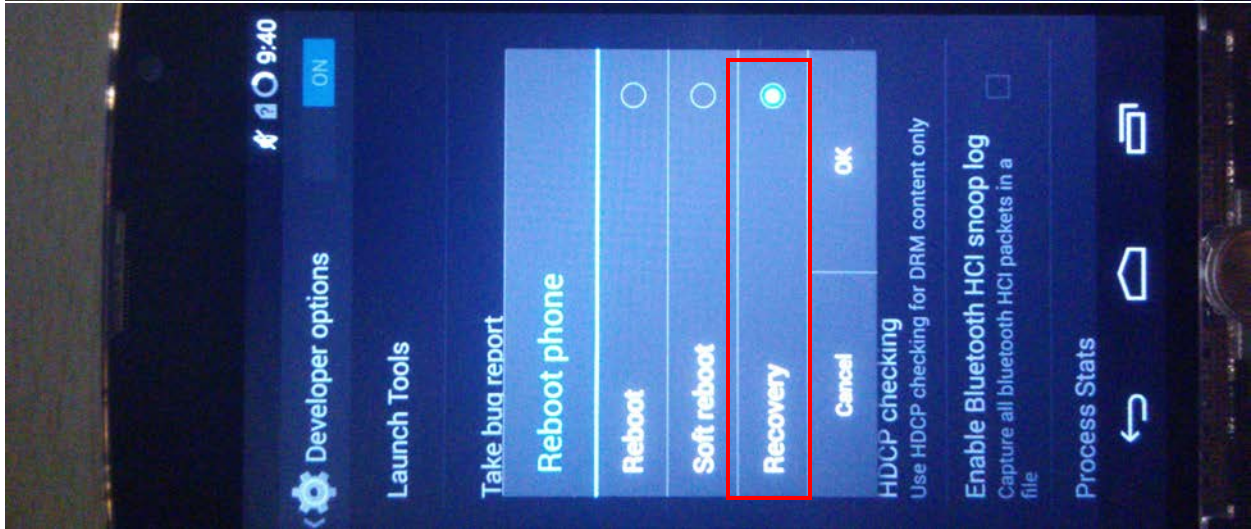

New Firefox boot animation

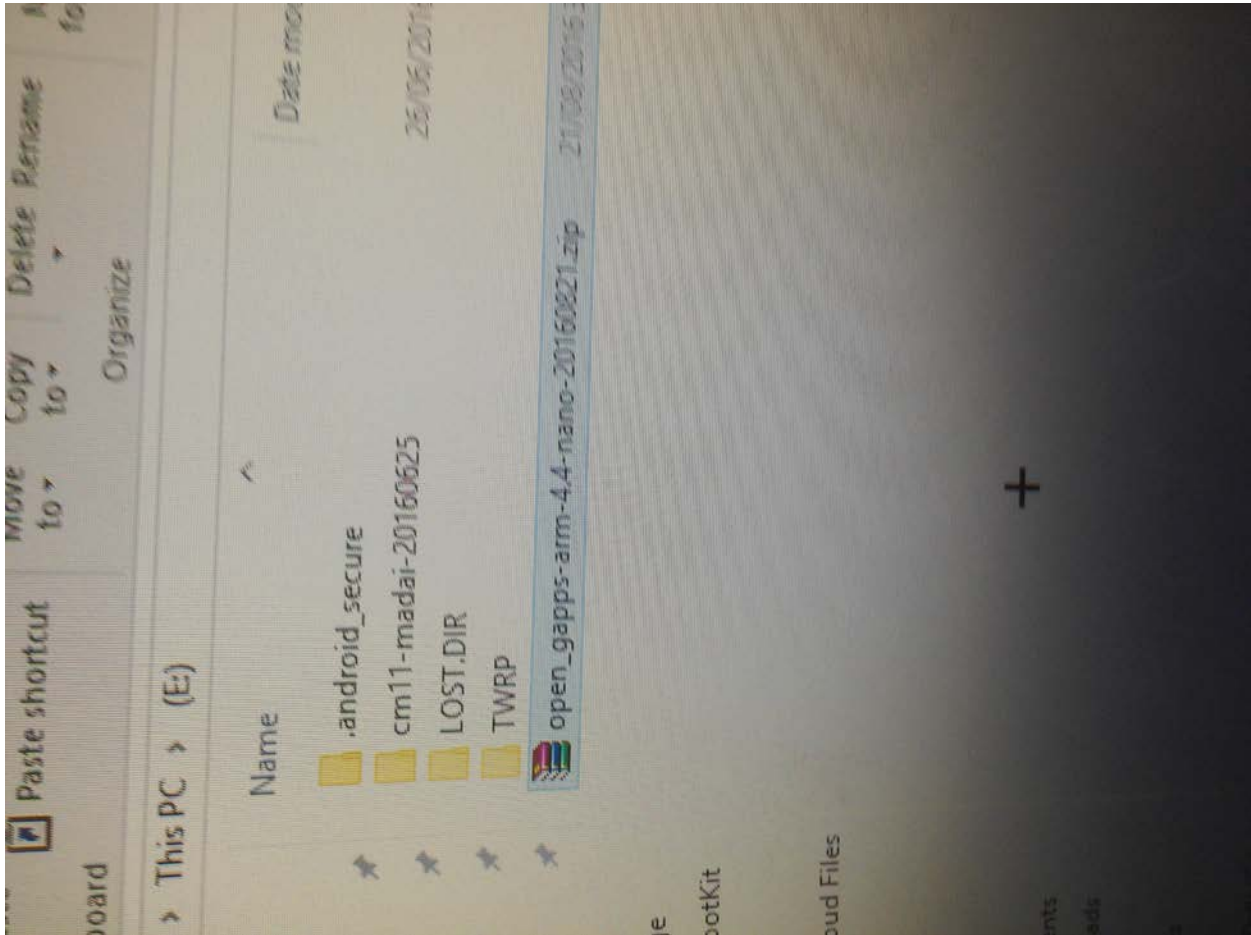

DONE!

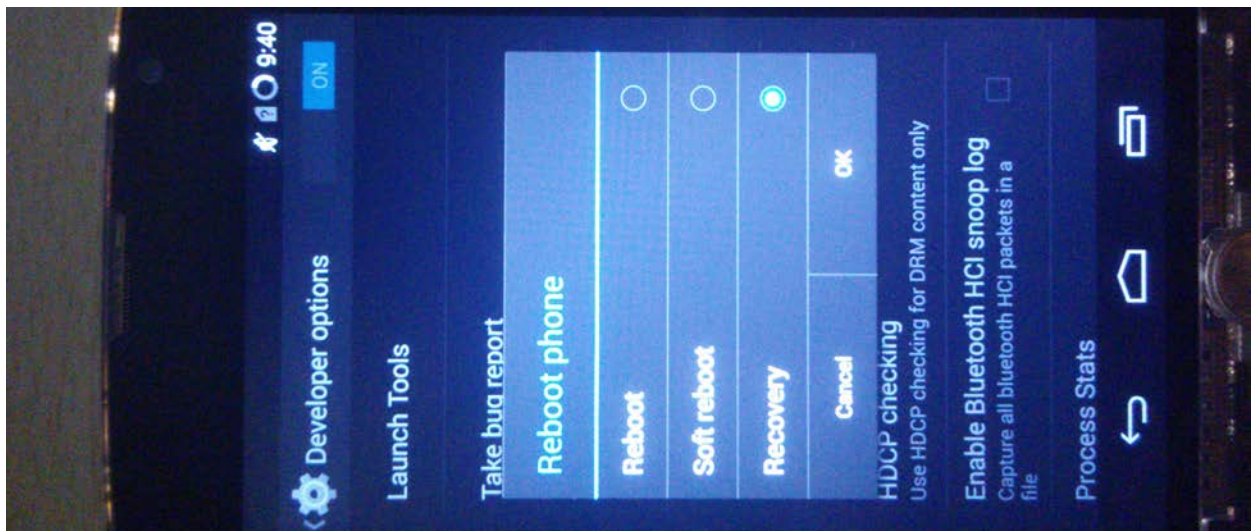

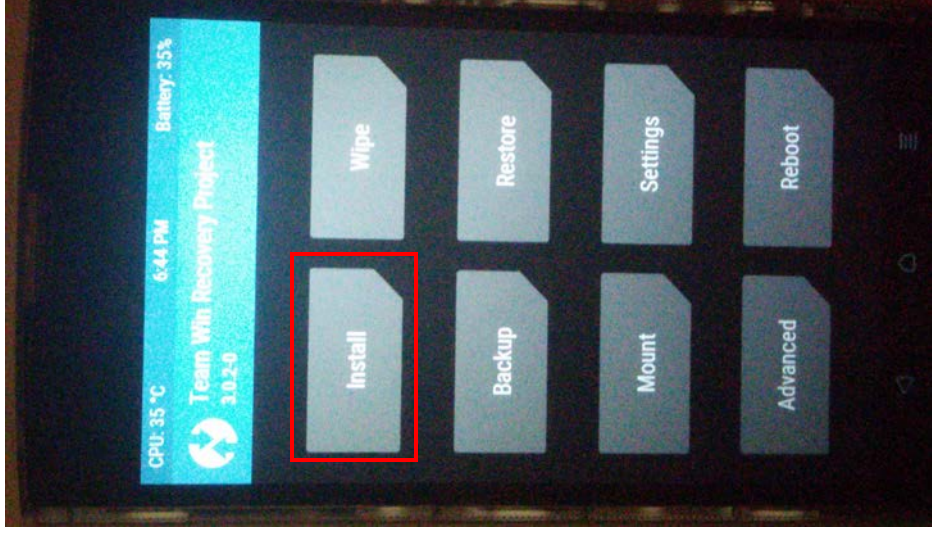

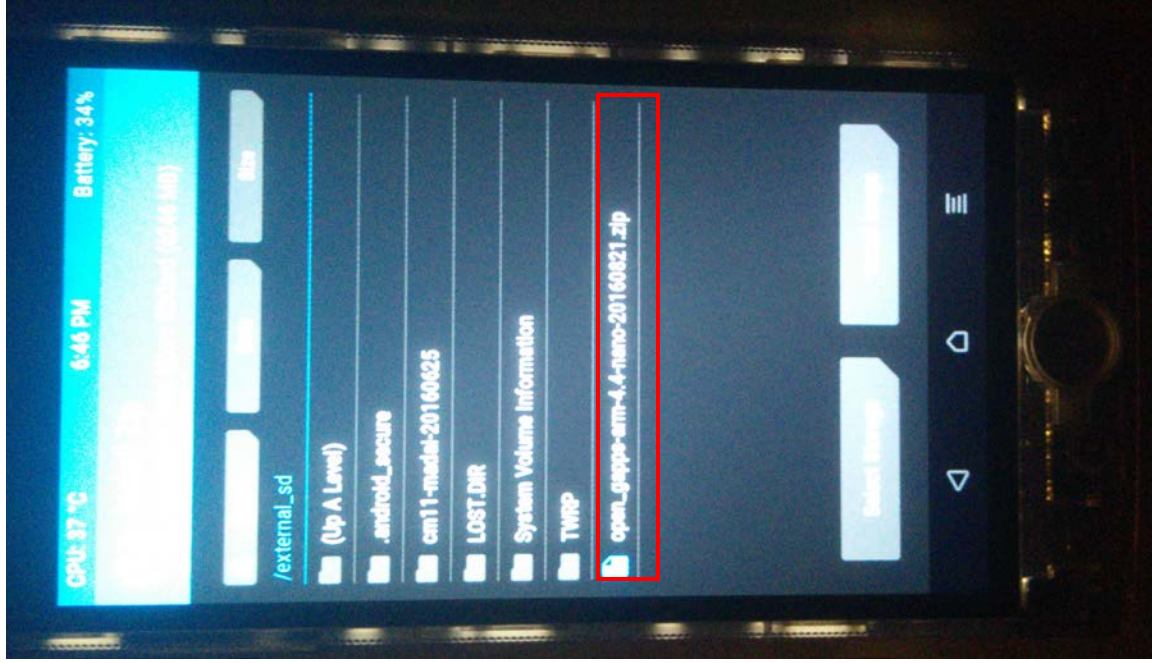

Install Gapps for Google Play Store:

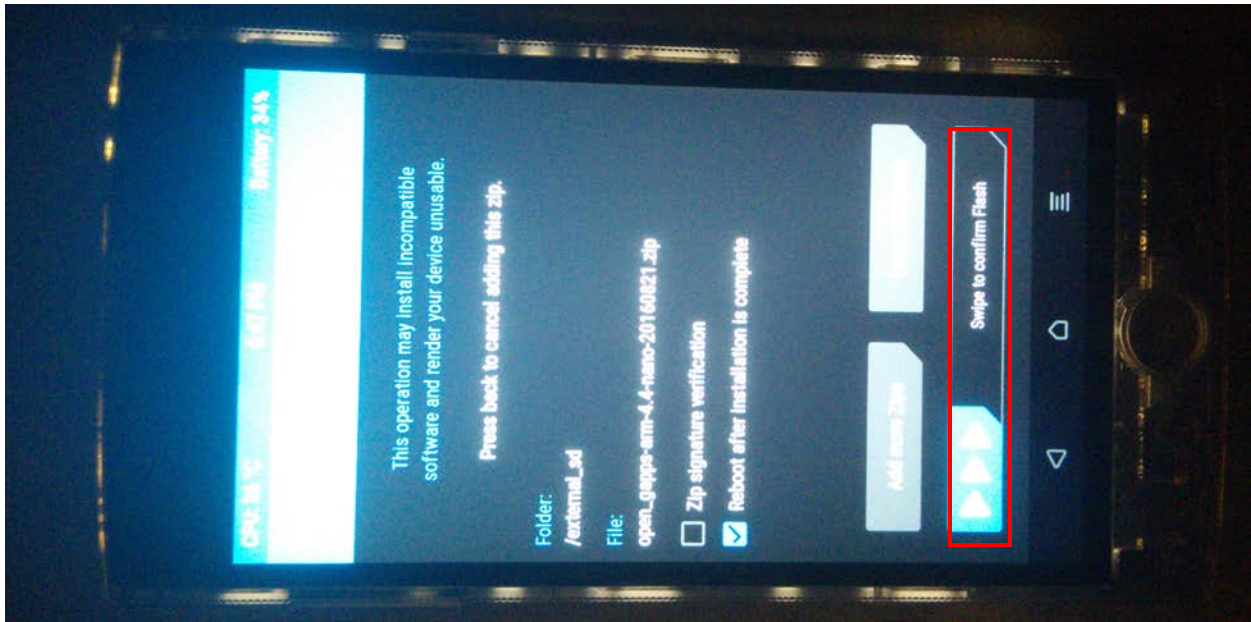

Download open_gapps-arm-4.4-nano-20160821.zip and put onto SDCARD or through Android usb file transfer

Reboot the phone into recovery

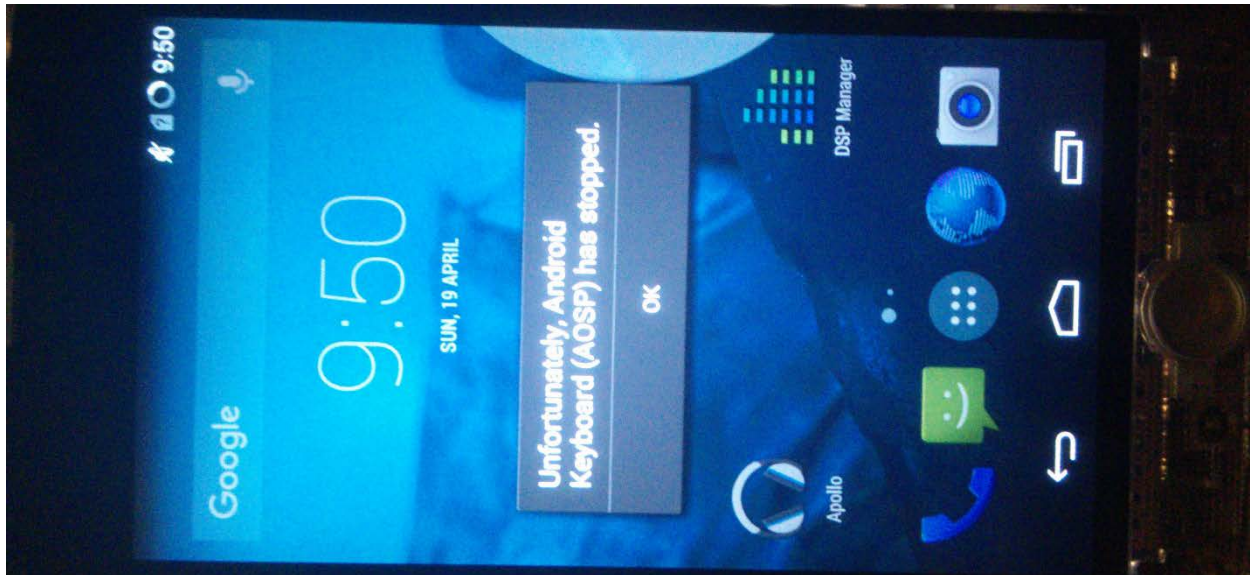

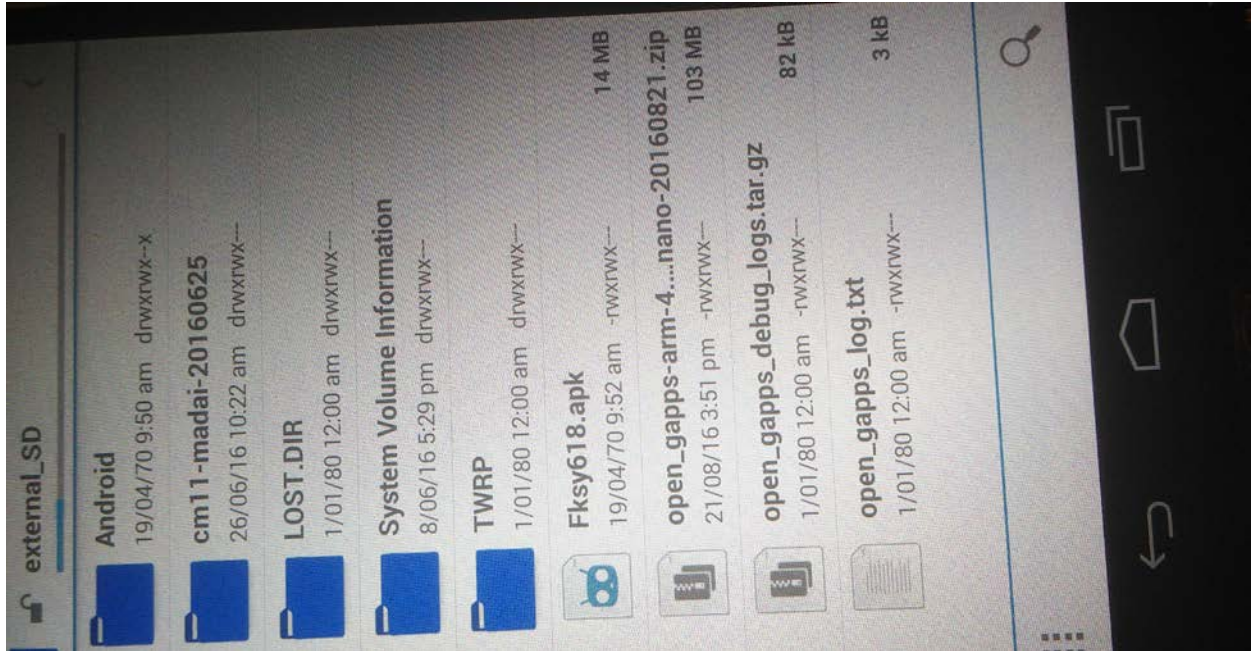

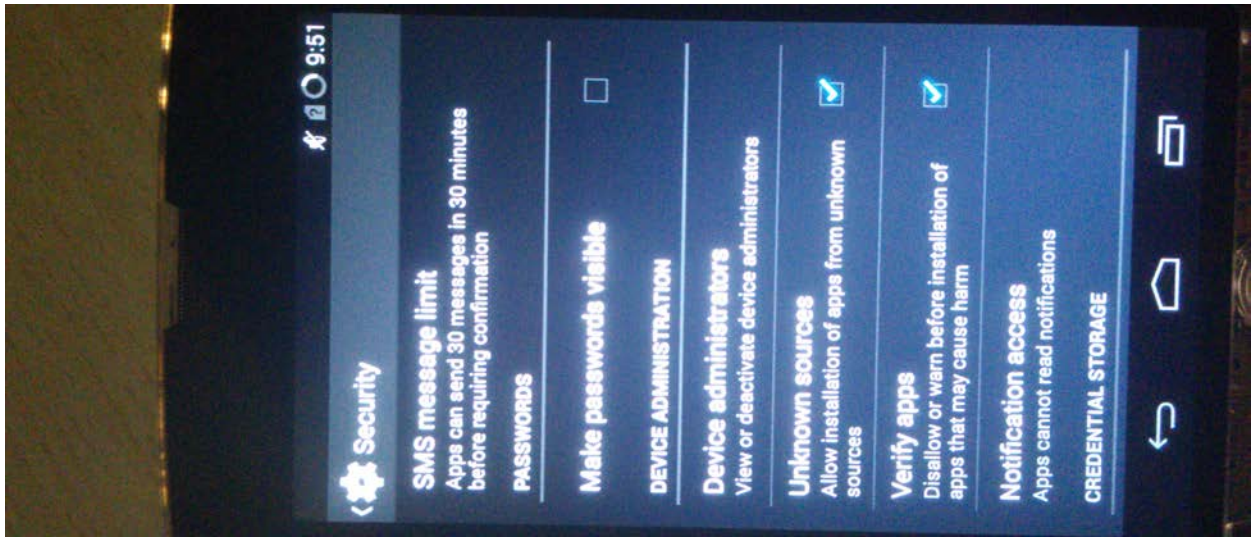

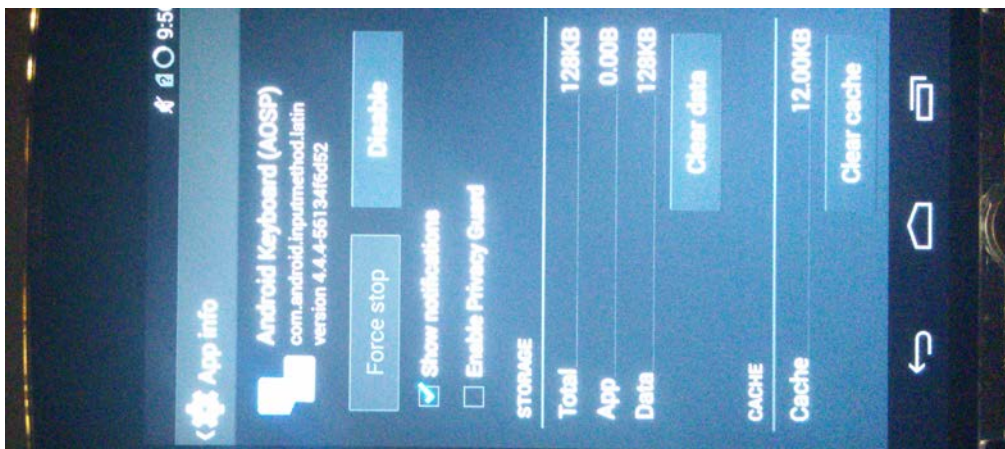

Reboot

Once the phone restarts, you may have an issue with the Keyboard not responding so what you can do is put SwiftKey, Fleksy Keyboard .apk file onto the sdcard and install through the phone after turning on Unknown Sources through Security settings.

Disable Android Keyboard
